

M93C86, M93C76, M93C66 M93C56, M93C46, M93C06

16Kbit, 8Kbit, 4Kbit, 2Kbit, 1Kbit and 256bit (8-bit or 16-bit wide)
MICROWIRE Serial Access EEPROM

FEATURES SUMMARY

- Industry Standard MICROWIRE Bus
- Single Supply Voltage:
 - 4.5V to 5.5V for M93Cx6
 - 2.5V to 5.5V for M93Cx6-W
 - 1.8V to 5.5V for M93Cx6-R
- Dual Organization: by Word (x16) or Byte (x8)
- Programming Instructions that work on: Byte, Word or Entire Memory
- Self-timed Programming Cycle with Auto-Erase
- Ready/ $\overline{\text{Busy}}$ Signal During Programming
- Speed:
 - 1MHz Clock Rate, 10ms Write Time (Current product, identified by process identification letter F or M)
 - 2MHz Clock Rate, 5ms Write Time (New Product, identified by process identification letter W)
- Sequential Read Operation
- Enhanced ESD/Latch-Up Behaviour
- More than 1 Million Erase/Write Cycles
- More than 40 Year Data Retention

Figure 1. Packages

M93C06 IS “NOT FOR NEW DESIGN”

The M93C06 is still in production, but is not recommended for new designs. Please refer to AN1571

on how to replace the M93C06 by the M93C46 in your application.

SUMMARY DESCRIPTION

These electrically erasable programmable memory (EEPROM) devices are accessed through a Serial Data Input (D) and Serial Data Output (Q) using the MICROWIRE bus protocol.

Figure 2. Logic Diagram

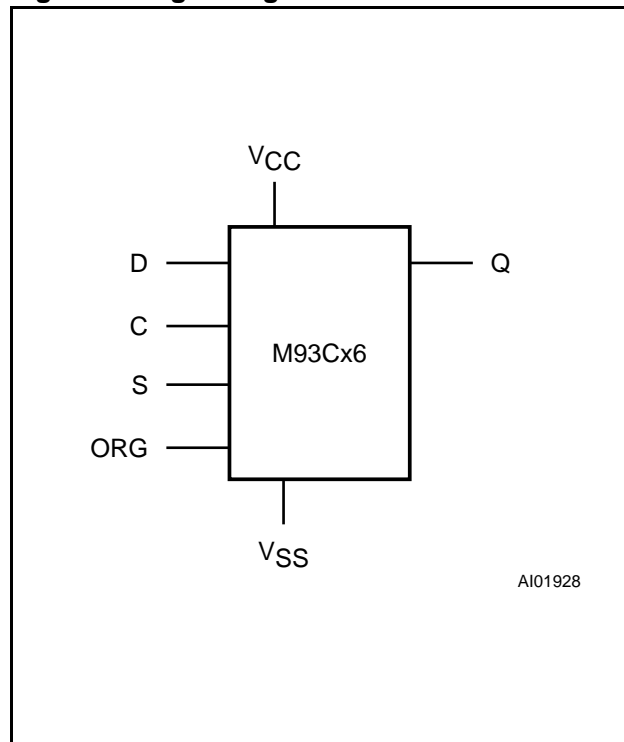

Table 1. Signal Names

S	Chip Select Input
D	Serial Data Input
Q	Serial Data Output
C	Serial Clock
ORG	Organisation Select
V _{CC}	Supply Voltage
V _{SS}	Ground

The memory array organization may be divided into either bytes (x8) or words (x16) which may be selected by a signal applied on Organization Select (ORG). The bit, byte and word sizes of the memories are as shown in Table 2.

Table 2. Memory Size versus Organization

Device	Number of Bits	Number of 8-bit Bytes	Number of 16-bit Words
M93C86	16384	2048	1024
M93C76	8192	1024	512
M93C66	4096	512	256
M93C56	2048	256	128
M93C46	1024	128	64
M93C06 ¹	256	32	16

Note: 1. Not for New Design

The M93Cx6 is accessed by a set of instructions, as summarized in Table 3, and in more detail in Table 4 to Table 6).

Table 3. Instruction Set for the M93Cx6

Instruction	Description	Data
READ	Read Data from Memory	Byte or Word
WRITE	Write Data to Memory	Byte or Word
EWEN	Erase/Write Enable	
EWDS	Erase/Write Disable	
ERASE	Erase Byte or Word	Byte or Word
ERAL	Erase All Memory	
WRAL	Write All Memory with same Data	

A Read Data from Memory (READ) instruction loads the address of the first byte or word to be read in an internal address register. The data at this address is then clocked out serially. The address register is automatically incremented after the data is output and, if Chip Select Input (S) is held High, the M93Cx6 can output a sequential stream of data bytes or words. In this way, the memory can be read as a data stream from eight to 16384 bits long (in the case of the M93C86), or continuously (the address counter automatically rolls over to 00h when the highest address is reached).

Programming is internally self-timed (the external clock signal on Serial Clock (C) may be stopped or left running after the start of a Write cycle) and does not require an Erase cycle prior to the Write instruction. The Write instruction writes 8 or 16 bits at a time into one of the byte or word locations of the M93Cx6. After the start of the programming cy-

cle, a Busy/Ready signal is available on Serial Data Output (Q) when Chip Select Input (S) is driven High.

An internal Power-on Data Protection mechanism in the M93Cx6 inhibits the device when the supply is too low.

Figure 3. DIP, SO and TSSOP Connections

Note: 1. See page 21 (onwards) for package dimensions, and how to identify pin-1.
2. DU = Don't Use.

Figure 4. 90° Turned-SO Connections

Note: 1. See page 24 for package dimensions, and how to identify pin-1.
2. DU = Don't Use.

The DU (Don't Use) pin does not contribute to the normal operation of the device. It is reserved for use by STMicroelectronics during test sequences. The pin may be left unconnected or may be connected to V_{CC} or V_{SS} . Direct connection of DU to V_{SS} is recommended for the lowest stand-by power consumption.

MEMORY ORGANIZATION

The M93Cx6 memory is organized either as bytes (x8) or as words (x16). If Organization Select (ORG) is left unconnected (or connected to V_{CC}) the x16 organization is selected; when Organization Select (ORG) is connected to Ground (V_{SS}) the x8 organization is selected. When the M93Cx6 is in stand-by mode, Organization Select (ORG) should be set either to V_{SS} or V_{CC} for minimum power consumption. Any voltage between V_{SS} and V_{CC} applied to Organization Select (ORG) may increase the stand-by current.

POWER-ON DATA PROTECTION

To prevent data corruption and inadvertent write operations during power-up, a Power-On Reset (POR) circuit resets all internal programming circuitry, and sets the device in the Write Disable mode.

- At Power-up and Power-down, the device must *not* be selected (that is, Chip Select Input (S) must be driven Low) until the supply voltage reaches the operating value V_{CC} specified in Table 8 to Table 10.
- When V_{CC} reaches its valid level, the device is properly reset (in the Write Disable mode) and is ready to decode and execute incoming instructions.

For the M93Cx6 devices (5V range) the POR threshold voltage is around 3V. For the M93Cx6-W (3V range) and M93Cx6-R (2V range) the POR threshold voltage is around 1.5V.

INSTRUCTIONS

The instruction set of the M93Cx6 devices contains seven instructions, as summarized in Table 4 to Table 6. Each instruction consists of the following parts, as shown in Figure 5:

- Each instruction is preceded by a rising edge on Chip Select Input (S) with Serial Clock (C) being held Low.
- A start bit, which is the first '1' read on Serial Data Input (D) during the rising edge of Serial Clock (C).
- Two op-code bits, read on Serial Data Input (D) during the rising edge of Serial Clock (C). (Some instructions also use the first two bits of the address to define the op-code).

- The address bits of the byte or word that is to be accessed. For the M93C46, the address is made up of 6 bits for the x16 organization or 7 bits for the x8 organization (see Table 4). For the M93C56 and M93C66, the address is made up of 8 bits for the x16 organization or 9 bits for the x8 organization (see Table 5). For the M93C76 and M93C86, the address is made up of 10 bits for the x16 organization or 11 bits for the x8 organization (see Table 6).

The M93Cx6 devices are fabricated in CMOS technology and are therefore able to run as slow as 0 Hz (static input signals) or as fast as the maximum ratings specified in Table 19 to Table 22.

Table 4. Instruction Set for the M93C46 and M93C06

Instruction	Description	Start bit	Op-Code	x8 Origination (ORG = 0)			x16 Origination (ORG = 1)		
				Address ^{1,2}	Data	Required Clock Cycles	Address ^{1,3}	Data	Required Clock Cycles
READ	Read Data from Memory	1	10	A6-A0	Q7-Q0		A5-A0	Q15-Q0

Note: 1. X = Don't Care bit.

2. Address bit A10 is not decoded by the M93C76.

3. Address bit A9 is not decoded by the M93C76.

Figure 5. READ, WRITE, EWEN, EWDS Sequences

Note: For the meanings of An, Xn, Qn and Dn, see Table 4, Table 5 and Table 6.

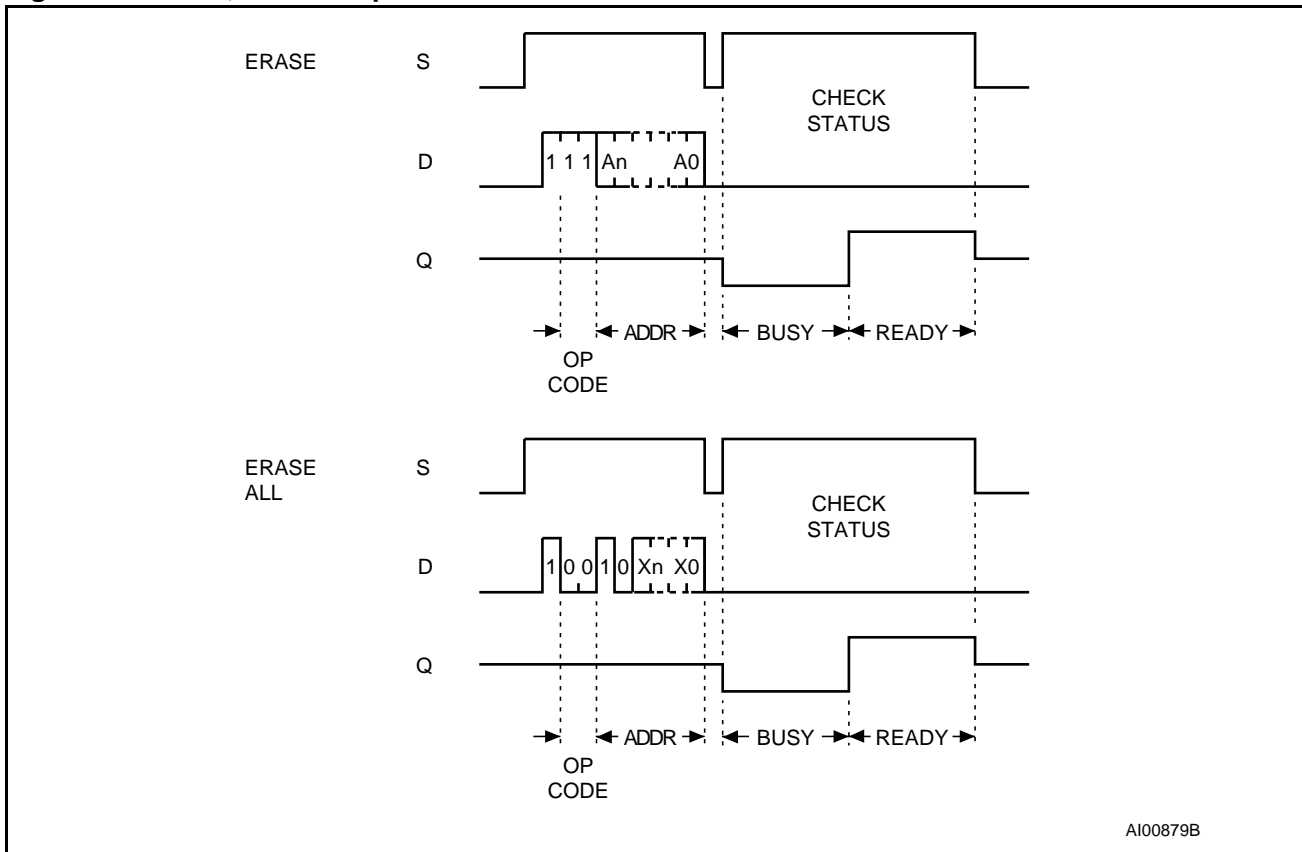

Read

The Read Data from Memory (READ) instruction outputs serial data on Serial Data Output (Q). When the instruction is received, the op-code and address are decoded, and the data from the memory is transferred to an output shift register. A dummy 0 bit is output first, followed by the 8-bit byte or the 16-bit word, with the most significant bit first. Output data changes are triggered by the rising edge of Serial Clock (C). The M93Cx6 automatically increments the internal address register and clocks out the next byte (or word) as long as the Chip Select Input (S) is held High. In this case, the dummy 0 bit is *not* output between bytes (or words) and a continuous stream of data can be read.

Erase/Write Enable and Disable

The Erase/Write Enable (EWEN) instruction enables the future execution of erase or write instructions, and the Erase/Write Disable (EWDS) instruction disables it. When power is first applied, the M93Cx6 initializes itself so that erase and write instructions are disabled. After an Erase/Write Enable (EWEN) instruction has been executed, erasing and writing remains enabled until an Erase/Write Disable (EWDS) instruction is executed, or until V_{CC} falls below the power-on reset threshold voltage. To protect the memory contents from accidental corruption, it is advisable to issue the Erase/Write Disable (EWDS) instruction after every write cycle. The Read Data from Memory (READ) instruction is not affected by the Erase/Write Enable (EWEN) or Erase/Write Disable (EWDS) instructions.

Figure 6. ERASE, ERAL Sequences

Note: For the meanings of A_n and X_n , please see Table 4, Table 5 and Table 6.

Erase

The Erase Byte or Word (ERASE) instruction sets the bits of the addressed memory byte (or word) to 1. Once the address has been correctly decoded, the falling edge of the Chip Select Input (S) starts the self-timed Erase cycle. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described on page 7.

Write

For the Write Data to Memory (WRITE) instruction, 8 or 16 data bits follow the op-code and address bits. These form the byte or word that is to be written. As with the other bits, Serial Data Input (D) is sampled on the rising edge of Serial Clock (C).

After the last data bit has been sampled, the Chip Select Input (S) must be taken Low before the next rising edge of Serial Clock (C). If Chip Select Input (S) is brought Low before or after this specific time frame, the self-timed programming cycle will not be started, and the addressed location will not be

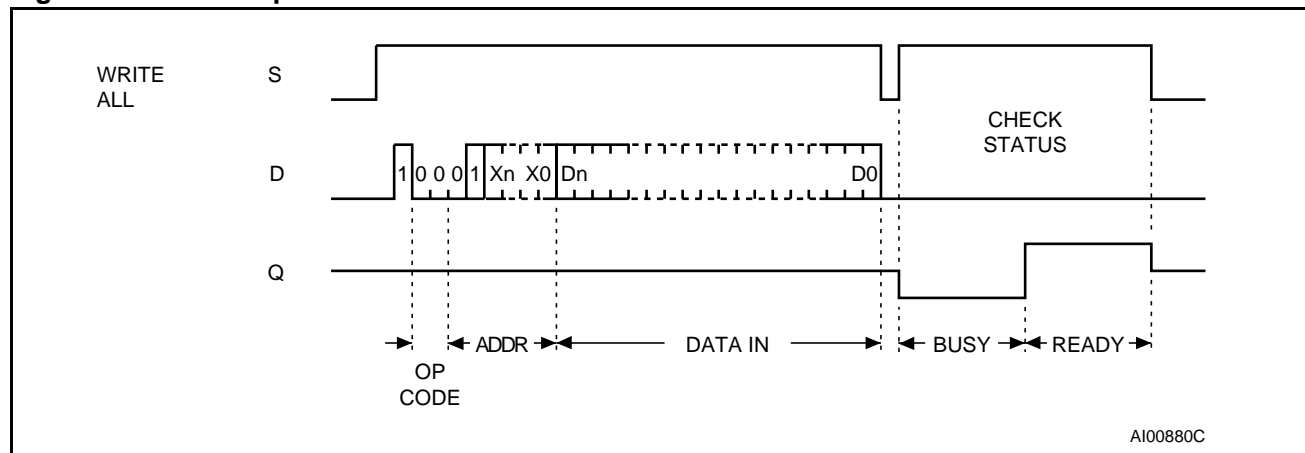

programmed. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described later in this document.

Once the Write cycle has been started, it is internally self-timed (the external clock signal on Serial Clock (C) may be stopped or left running after the start of a Write cycle). The cycle is automatically preceded by an Erase cycle, so it is unnecessary to execute an explicit erase instruction before a Write Data to Memory (WRITE) instruction.

Erase All

The Erase All Memory (ERAL) instruction erases the whole memory (all memory bits are set to 1). The format of the instruction requires that a dummy address be provided. The Erase cycle is conducted in the same way as the Erase instruction (ERASE). The completion of the cycle can be detected by monitoring the Ready/Busy line, as described on page 7.

Figure 7. WRAL Sequence

Note: For the meanings of Xn and Dn, please see Table 4, Table 5 and Table 6.

Write All

As with the Erase All Memory (ERAL) instruction, the format of the Write All Memory with same Data (WRAL) instruction requires that a dummy address be provided. As with the Write Data to Memory (WRITE) instruction, the format of the Write All Memory with same Data (WRAL) instruction requires that an 8-bit data byte, or 16-bit data word, be provided. This value is written to all the addresses of the memory device. The completion of the cycle can be detected by monitoring the Ready/Busy line, as described next.

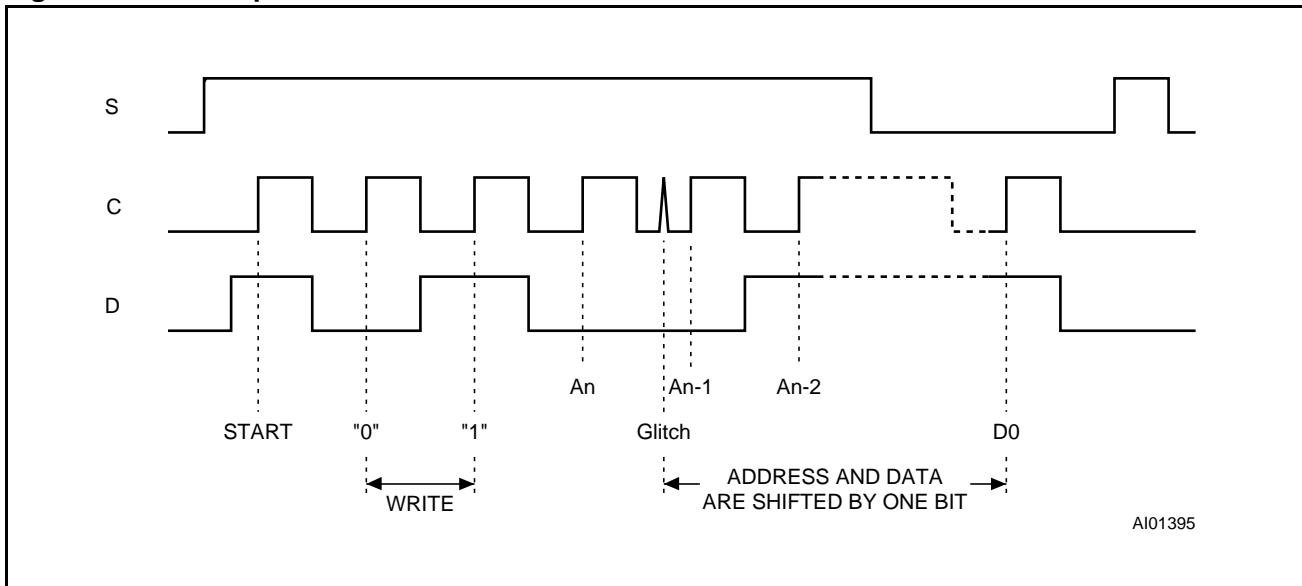

READY/BUSY STATUS

While the Write or Erase cycle is underway, for a WRITE, ERASE, WRAL or ERAL instruction, the Busy signal ($Q=0$) is returned whenever Chip Select Input (S) is driven High. (Please note, though, that there is an initial delay, of t_{SLSH} , before this

status information becomes available). In this state, the M93Cx6 ignores any data on the bus. When the Write cycle is completed, and Chip Select Input (S) is driven High, the Ready signal ($Q=1$) indicates that the M93Cx6 is ready to receive the next instruction. Serial Data Output (Q) remains set to 1 until the Chip Select Input (S) is brought Low or until a new start bit is decoded.

COMMON I/O OPERATION

Serial Data Output (Q) and Serial Data Input (D) can be connected together, through a current limiting resistor, to form a common, single-wire data bus. Some precautions must be taken when operating the memory in this way, mostly to prevent a short circuit current from flowing when the last address bit (A0) clashes with the first data bit on Serial Data Output (Q). Please see the application note AN394 for details.

Figure 8. Write Sequence with One Clock Glitch**CLOCK PULSE COUNTER**

In a noisy environment, the number of pulses received on Serial Clock (C) may be greater than the number delivered by the master (the microcontroller). This can lead to a misalignment of the instruction of one or more bits (as shown in Figure 8) and may lead to the writing of erroneous data at an erroneous address.

To combat this problem, the M93Cx6 has an on-chip counter that counts the clock pulses from the start bit until the falling edge of the Chip Select Input (S). If the number of clock pulses received is not the number expected, the WRITE, ERASE,

ERASE or WRAL instruction is aborted, and the contents of the memory are not modified.

The number of clock cycles expected for each instruction, and for each member of the M93Cx6 family, are summarized in Table 4 to Table 6. For example, a Write Data to Memory (WRITE) instruction on the M93C56 (or M93C66) expects 20 clock cycles (for the x8 organization) from the start bit to the falling edge of Chip Select Input (S). That is:

- 1 Start bit
- + 2 Op-code bits
- + 9 Address bits
- + 8 Data bits

MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 7. Absolute Maximum Ratings

Symbol	Parameter	Min.	Max.	Unit
T _{STG}	Storage Temperature	-65	150	°C
T _{LEAD}	Lead Temperature during Soldering PDIP: 10 seconds SO: 20 seconds (max) ¹ TSSOP: 20 seconds (max) ¹		260 235 235	°C

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measure-

ment Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

V_{OH}	Output High Voltage (Q)	$V_{CC} = 5V$, $I_{OH} = -400\mu A$	2.4		V
		$V_{CC} = 2.5V$, $I_{OH} = -100\mu A$	$V_{CC} - 0.2$		V

Note: 1. New product: identified by Process Identification letter W.

Table 18. DC Characteristics (M93Cx6-R)

Symbol	Parameter	Test Condition	Min. ¹	Max. ¹	Unit
I_{LI}	Input Leakage Current	$0V \leq V_{IN} \leq V_{CC}$		± 2.5	μA
I_{LO}	Output Leakage Current	$0V \leq V_{OUT} \leq V_{CC}$, Q in Hi-Z		± 2.5	μA
I_{CC}	Supply Current (CMOS Inputs)	$V_{CC} = 5V$, $S = V_{IH}$, $f = 2$ MHz		2	mA
		$V_{CC} = 1.8V$, $S = V_{IH}$, $f = 1$ MHz		1	mA
I_{CC1}	Supply Current (Stand-by)	$V_{CC} = 1.8V$, $S = V_{SS}$, $C = V_{SS}$, ORG = V_{SS} or V_{CC}		2	μA
V_{IL}	Input Low Voltage (D, C, S)		-0.3	$0.2 V_{CC}$	V
V_{IH}	Input High Voltage (D, C, S)		$0.8 V_{CC}$	$V_{CC} + 1$	V
V_{OL}	Output Low Voltage (Q)	$V_{CC} = 1.8V$, $I_{OL} = 100\mu A$		0.2	V
V_{OH}	Output High Voltage (Q)	$V_{CC} = 1.8V$, $I_{OH} = -100\mu A$	$V_{CC} - 0.2$		V

Note: 1. This product is under development. For more information, please contact your nearest ST sales office.

PART NUMBERING

Table 23. Ordering Information Scheme

Example:	M93C86	–	T	W	MN	6	T
Device Type							
M93 = MICROWIRE serial access EEPROM							
Device Function							
86 = 16 Kbit (2048 x 8)							
76 = 8 Kbit (1024 x 8)							
66 = 4 Kbit (512 x 8)							
56 = 2 Kbit (256 x 8)							
46 = 1 Kbit (128 x 8)							
06 ² = 256 bit (32 x 8)							
Turned Die							
blank = Normal (untuned) Die							
T ⁴ = 90° Turned Die							
Operating Voltage							
blank = V _{CC} = 4.5 to 5.5V							
W = V _{CC} = 2.5 to 5.5V							
R = V _{CC} = 1.8 to 5.5V							
Package							
BN = PDIP8							
MN = SO8 (150 mil width)							
DW = TSSOP8 (169 mil width)							
DS ³ = TSSOP8 (3x3mm body size)							
Temperature Range							
6 = –40 to 85 °C							
3 ¹ = –40 to 125 °C							
Option							
T = Tape & Reel Packing							

Note: 1. Produced with High Reliability Certified Flow (HRCF).

2. M93C06 is "Not for New Design".

3. Available only on new products: identified by the Process Identification letter W.

4. Turned die option is not available for all devices. Please contact your nearest STMicroelectronics Sales Office.

Devices are shipped from the factory with the memory content set at all 1s (FFFFh for x16, FFh for x8).

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST Sales Office.

Table 24. How to Identify Current and New Products by the Process Identification Letter

Markings on Current Products ¹	Markings on New Products ¹
M93C46W6 AYWWF (or AYWWM)	M93C46W6 AYWWW

Note: 1. This example comes from the S08 package. Other packages have similar information. For further information, please ask your ST Sales Office for Process Change Notice PCN MPG/EE/0059 (PCEE0059).

REVISION HISTORY

Table 25. Document Revision History

Date	Rev.	Description of Revision
04-Feb-2003	2.0	Document reformatted, and reworded, using the new template. Temperature range 1 removed. TSSOP8 (3x3mm) package added. New products, identified by the process letter W, added, with $f_c(\text{max})$ increased to 1MHz for -R voltage range, and to 2MHz for all other ranges (and corresponding parameters adjusted)
26-Mar-2003	2.1	Value of standby current (max) corrected in DC characteristics tables for -W and -R ranges V_{OUT} and V_{IN} separated from V_{IO} in the Absolute Maximum Ratings table
04-Apr-2003	2.2	Values corrected in AC characteristics tables for -W range (t_{SLSH} , t_{DVCH} , t_{CLSL}) for devices with Process Identification Letter W
23-May-2003	2.3	Standby current corrected for -R range
27-May-2003	2.4	Turned die option re-instated in Ordering Information Scheme
