Philips Semiconductors

PHILIPS

Hi-fi stereo audio processor; I²C-bus TDA8425

GENERAL DESCRIPTION

The TDA8425 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel facility, digitally controlled via the I²C-bus for application in hi-fi audio and television sound.

Feature:

- Source and mode selector for two stereo channels
- Pseudo stereo, spatial stereo, linear stereo and forced mono switch
- Volume and balance control
- Bass, treble and mute control
- Power supply with power-on reset

QUICK REFERENCE DATA

PARAMETER	SYMBOL	MIN.	TYP.	MAX.	UNIT
Supply voltage (pin 4)	V_{CC}	10.8	12.0	13.2	V
Input signal handling	V_I	2	–	–	V
Input sensitivity					
full power at the output stage	V_i	–	300	–	mV
Signal plus noise-to-noise ratio	(S+N)/N	–	86	–	dB
Total harmonic distortion	THD	–	0.05	–	%
Channel separation	α	–	80	–	dB
Volume control range	G	–64	–	6	dB
Treble control range	G	–12	–	12	dB
Bass control range	G	–12	–	15	dB

PACKAGE OUTLINE

20-lead dual in-line; plastic (SOT146); SOT146-1; 1996 November 26.

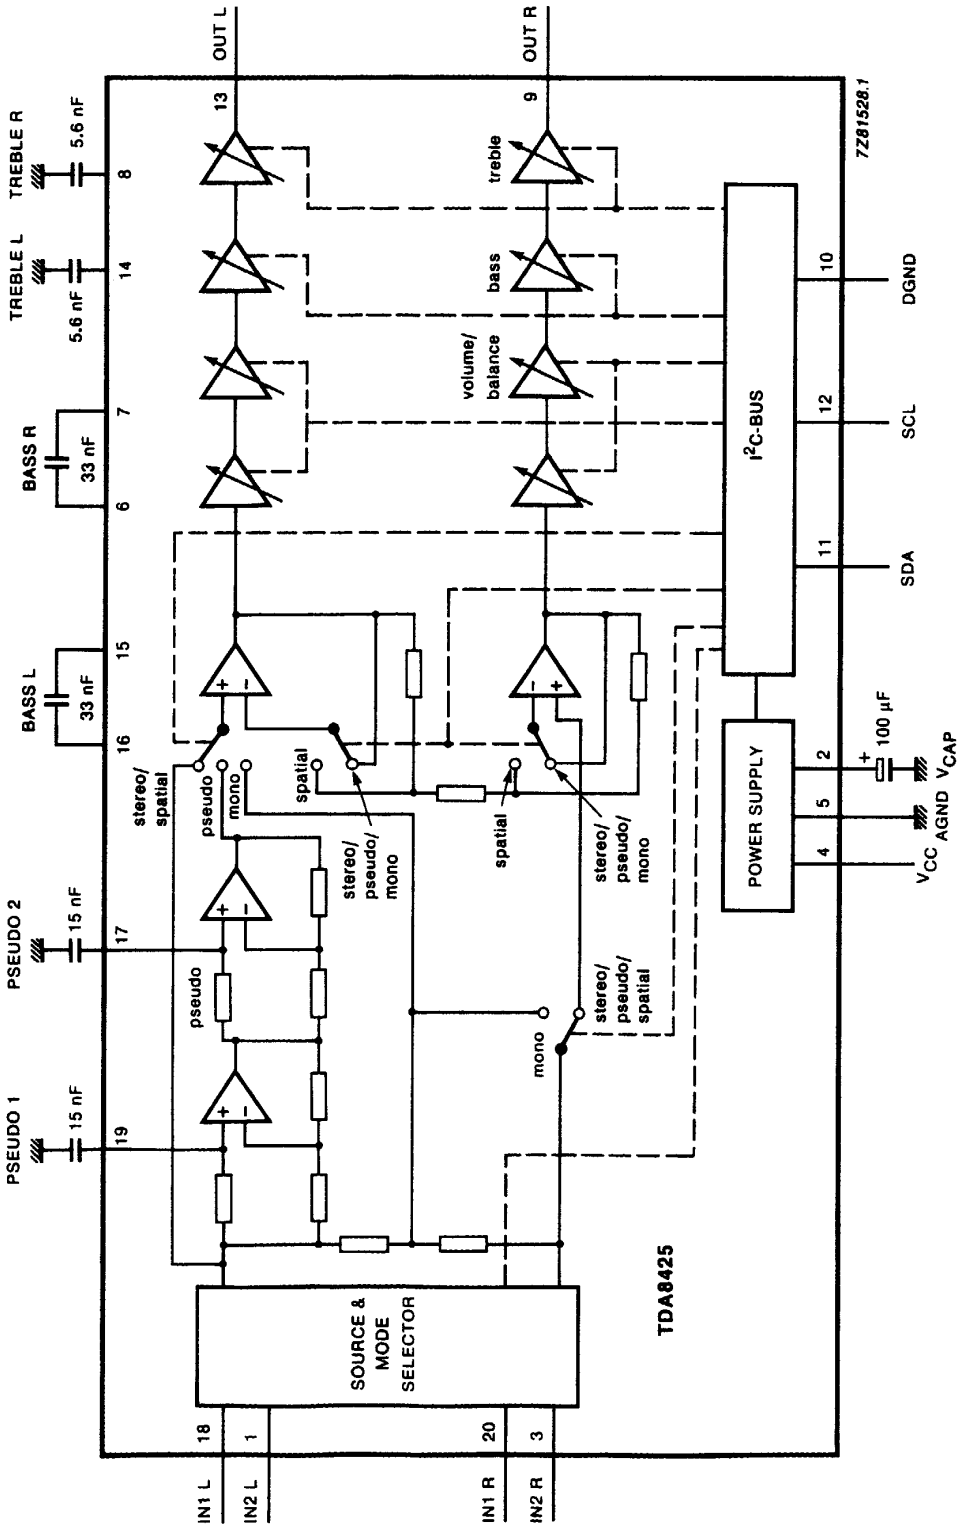

Fig.1 Block diagram.

PINNING

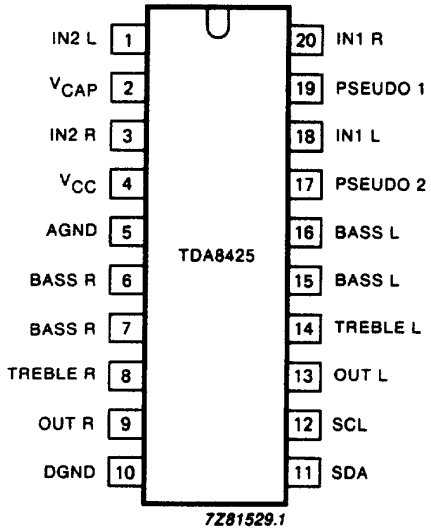

Fig.2 Pinning diagram.

FUNCTIONAL DESCRIPTION

Source selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the source selector. The selection is made from the following AF input signals:

- IN 1 L (pin 18); IN1 R (pin 20)
  or
- IN2 L (pin 1); IN2 R (pin 3)

Mode selector

The mode selector selects between stereo, sound A and sound B (in the event of bilingual transmission) for OUT R and OUT L.

Volume control and balance

The volume control consists of two stages (left and right). In each part the gain can be adjusted between +6 dB and −64 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 80 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right output channels.

Linear stereo, pseudo stereo, spatial stereo and forced mono mode(1)

It is possible to select four modes: linear stereo, pseudo stereo, spatial stereo or forced mono. The pseudo stereo mode handles mono transmissions, the spatial stereo mode handles stereo transmissions and the forced mono can be used in the event of stereo signals.

(1) During forced mono mode the pseudo stereo mode cannot be used.

Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

Treble control

The treble control stage can be switched from +12 dB to –12 dB in steps of 3 dB.

Bias and power supply

The TDA8425 includes a bias and power supply stage, which generates a voltage of $0.5 \times V_{CC}$ with a low output impedance and injector currents for the logic part.

Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both parts of the treble amplifier. The muting can be switched by transmission of the mute bit.

I²C-bus receiver and data handling

Bus specification

The TDA8425 is controlled via the 2-wire I²C-bus by a microcomputer.
The two wires (SDA – serial data, SCL – serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor.
When the bus is free both lines are HIGH.
The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition.
A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.
The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition.
The bus is considered to be free again after a stop condition.

Module address

Data transmission to the TDA8425 starts with the module address MAD.

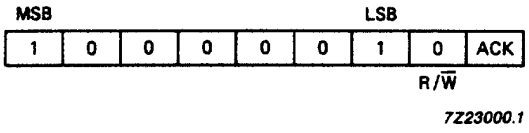

Fig.3 TDA8425 module address.

Subaddress

After the module address byte a second byte is used to select the following functions:

- Volume left, volume right, bass, treble and switch functions

The subaddress SAD is stored within the TDA8425. Table 1 defines the coding of the second byte after the module address MAD.

Table 1 Second byte after module address MAD

	128	64	32	16	8	4	2	1
	MSB							LSB
function	7	6	5	4	3	2	1	0
volume left	0	0	0	0	0	0	0	0
volume right	0	0	0	0	0	0	0	1
bass	0	0	0	0	0	0	1	0
treble	0	0	0	0	0	0	1	1
switch functions	0	0	0	0	1	0	0	0
					subaddress SAD			

The automatic increment feature of the slave address enables a quick slave receiver initialization, within one transmission, by the I²C-bus controller (see Fig.5).

Definition of 3rd byte

A third byte is used to transmit data to the TDA8425. Table 2 defines the coding of the third byte after module address MAD and subaddress SAD.

Table 2 Third byte after module address MAD and subaddress SAD

		MSB							LSB

Sequence of data transmission

After a power-on reset all five functions have to be adjusted with five data transmissions. It is recommended that data information for switch functions are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 6. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
