

DM7476

Dual Master-Slave J-K Flip-Flops with Clear, Preset, and Complementary Outputs

General Description

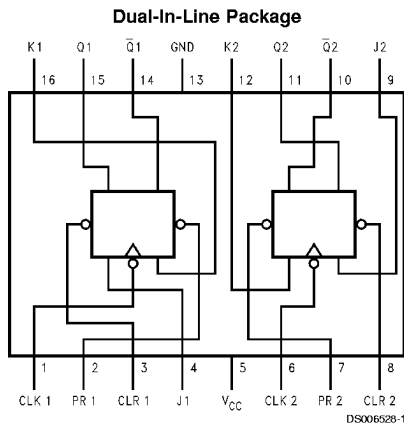

This device contains two independent positive pulse triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flop after a complete clock pulse. While the clock is low the slave is isolated from the master. On the positive transition of the clock, the data from the J and K inputs is transferred to the master. While the clock is high the J and K inputs are disabled. On the negative transition of the clock, the data from the master is transferred to the slave. The logic state of J and K inputs must not be al-

lowed to change while the clock is high. The data is transferred to the outputs on the falling edge of the clock pulse. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

Features

- Alternate Military/Aerospace device (5476) is available. Contact a Fairchild Semiconductor Sales Office/Distributor for specifications.

Function Table

Inputs					Outputs	
PR	CLR	CLK	J	K	Q	\bar{Q}
L	H	X	X	X	H	L
H	L	X	X	X	L	H
L	L	X	X	X	H	H
H	H	\neg	L	L	(Note 1) Q_0	(Note 1) \bar{Q}_0
H	H	\neg	H	L	H	L
H	H	\neg	L	H	L	H
H	H	\neg	H	H	Toggle	

H = High Logic Level
L = Low Logic Level
X = Either Low or High Logic Level
 \neg = Positive pulse data. The J and K inputs must be held constant while the clock is high. Data is transferred to the outputs on the falling edge of the clock pulse.
 Q_0 = The output logic level before the indicated input conditions were established.
Toggle = Each output changes to the complement of its previous level on each complete active high level clock pulse.
Note 1: This configuration is nonstable; that is, it will not persist when the preset and/or clear inputs return to their inactive (high) level.

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

I _{CC}	Supply Current	V _{CC} = Max (Note 6)		18	34	mA

Note 3: The symbol (↑, ↓) indicates the edge of the clock pulse is used for reference (↑) for rising edge, (↓) for falling edge.

Note 4: All typicals are at V_{CC} = 5V, T_A = 25°C.

Note 5: Not more than one output should be shorted at a time.

Note 6: With all outputs open, I_{CC} is measured with the Q and \bar{Q} outputs high in turn. At the time of measurement the clock input is grounded.

Note 7: Clear is measured with preset high and preset is measured with clear high.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
